

Part 2

work completed to each phase now, past, future, schedule of milestones by a realistic budget to propose what can be done when extrapolation is undertaken with realism

Enduring is our commitment to this branch of affairs to advance peaceful ventures into outer space. We understand that human presence in there beyond earth marks our initial departure from home cradle and that many systems will be built to last so processes support humanity's venture into the greater spaces where we were not previously

Venture over oceans navigation by the stars now, to the stars

Hope of humanity the seemingly only a sliver of future hope can grow

in transit the event perpetuating

If by treads each serious step we grow strong, the time elapsed ought let visible an overview some commendable knowledge of the endeavour, even in its entirety, to a time we decided so the world will know what vision beheld to drive and compel each minute task the way into the future be set in these and these particular details to the cohesive whole

Human exploration the percentage of the agency's budget for motion towards the realization of this aspect of human Destiny

Earlier infinitely far away and never to be attained finally the means to achieve the distances are nearly at hand

The future this is just the beginning

reverence

togetherness

spaceship earth

humans to enter the cosmic context

The distance between this star the sun and the next star immense and unachievable to date the view naturally delimits itself to the realm that is achievable, and has been achieved

With humility strongly applied the immensities become local and measure is ascribed into this place where thus measure to place, the place gains location albeit in movement therefore returned to a timetable stretching decades within which blocks missions are planned

Assurances by budget is granted the tableau for works in time and space, and degree of freedom for operations in assay

operations in parallel but in series by general objective

To lay down the markers and cornerstones to the future Great Space Enterprise is the current apropos to the general program of today. These next decades will begin and no commencement no birth were easy but calculated pitches into the field to found the play so populating the field of spatio-temporal fabric of the universe, with discrete efforts that demonstrate novel capacities to be long applied into the future with ever numerous projects that occupy the timetable of manned endeavor to situate outer space: this is our goal, to place ourselves Humans into the wide expanse by a system which we will now generate to that tomorrow where future generations can expand and decompress the intricacies and The Plan to a wider survey through our very presence in the solar system

The assertion founded within the celestial orbits of shifts in gravitational field, an inscribed order within a cosmic order to be generated.

A phase of planning and coordination precedes every cycle
where research is consolidated so knowledge extrapolates to functional milestones and realistic budget the timetable for the following cycle then be forged let the staffing find experts be contracted whether from within or without their positions in the agency so an organization unique continues to emerge at each and each mission oriented cycle to date
Let decisions not be arbitrary to the whims of the moment rather to the elusive plan though tacit of founding the enterprise on solid footing
Circumstances tickling fancy or fright be minimized for that public opinion be maintained steady so funds expected will be allotted
The timetable and the staff to a mission orientation be revised duly so the potential for opportunity only expands and is steady too

Findings from research consolidation and extrapolation should reach the light not only to shed light on the emergent plan but to the public eye
So review by the public lends pace to the enterprise's progress
The progress of the manned mission a concern for all the public - the public gives clarity to that the enterprise be steady and paced achieving its objectives by each measure with surety and grace

That the Plan should exist is of utmost importance
for the endeavor so grand all wish to know of its direction and heading
that its should be in development slowly and surely it should come to light for contemplation by the public, yes, for the long future of what would become a great enterprise but too for the minute organizing within the agency and the industry to rearrange internal affairs for the most promising to be advanced, realistically, surely, steadily

Dreams have ways of spinning, but this dream in particularly is elusive in its particularity, how humans should go to space and stay there for a long future, how difficult the task to be at hand, how complex the systems to be forwarded, these too should reach the ears of those who inquire, so for them to know that our progress is nuanced and at once at great leaps

The public should know more

That orientation of affairs has to be made so position and plan be evidence for continuance by public support and by organized development
the endeavour by its scale achieved and projected needs gain visibility and understanding

Coherence to view is not undermined for that knowing the course is prerequisite to a long term stable enterprise. That the enterprise is grand yet discrete and humble, then the league of scientists and engineers and philosophers and poets and artists should band in support for the agenda carried along on each mission, the overarching view to be made for long term sustainability of the steering of the Enterprise.

New Utopia

living in the world we make

That a world to be realized is afoot a world to be made in cosmos

Laying grounds for a future world

Reason

Public media sustainability of the manned missions, for Peace, depends on the rationale

Research and public understanding, of the weight the profundity of the endeavour

Question like what is the reality being sought the significance in history to the scale of civilization in the essential missions in this stage of development, what opportunity in present day to impactfully realize what in history So identifying the centralizing questions for the Reason of the manned missions as stated And treat as a systematic study what does the conception and the laying out and the execution the missions to space, for Peace

An American Future

The admission of the nascency of the apropos

Lays open the grandeur of the endeavour

A call for humanist thinking to support public communication garnering continuation and expansion of the program under the Apropos and Proposition of Human Being in Space, for a Proposal to the Public in support for continuance in manned missions space programs

To form a problematic for that the question has solutions immediate to current and future missions' continuance

From the inquiry, is the sustainability of the program intimately tied to the profound understanding of the proposition of being in space? What meant by humanist thinking by this line of reasoning productive where in pure thought engendered from what cultural principles and historical decisions, rend the Reason the coherence to be founded of the Plan in general

The irrevocability of knowledge therein the reason and the plan, the understanding has an intrinsic value this matter already tacit in the agency and industry's work but to be made explicit to show the weight and profundity of the endeavor

The understanding of what endeavour is found in philosophical and humanist foundations, for media content to be representative of the intuition and ultimately knowledge brings to sophistication the effective public media

So such,

Cosmosological existence yet be of great benefit to humanity in progress be it material or spiritual;

Life and work in actuality producing a world;

Demands be satisfied in the curiosity and investment in the future questions of space on the minds of the public;

Public communication in content demonstrate the agency's understanding of its own apropos, agenda, and tasks;

What is a spaceplane?

What is a Gateway?

Refueling stations?

Starflight must be done

Having found the spacefaring spirit in continuing research, the faring into space must be done through craft, vehicle, and human presence

Voyagers over oceans those early bands unique in their times are those later we are all descended from, America!

The cosmic significance of human existence can be realized as being is a moment but within all directions stems from the proposition to be realized of the human being in space

The televista is the field of multidimensional logistics in outer space supporting crafts and lives in the universe at large

Could it be cosmogony, a long future view of the space program as in time immemorial, this now event is the birth to the rise of a world?

The endurance of knowledge at this culmination, of mathematics, of astronomy, of philosophy, of medicine, of arts, of ...

So our crafts are complectic designs; though each like a point in infinitude, each a compressed intelligence in its holism houses great potential of the generative nature

Even the question of the transit of spirit return to the Earth's cradle, Home...

Survey of deep space now the awareness of the human proposition as imbued with great prospect, the cosmological scale in this the imprint of humanity to be made extending into further reaches

Oh the small steps to lay the cornerstones What markers to what extent but our proximity for now this solar system, at the inner sphere From this effort to begin the groundworks of what could be The dream of terra the grounding substance as aether in space extending in all directions to the infinitudes of the omnisphere this is the universe

So our gaze elevate beyond the koinos cosmos of earth

So let the pebbles be strewn all about on grounds that smell distinctly cosmical

This is to allow the space age to begin earnestly in time rend the foundation what initial conditions of our own ascription upon what lies there in vast expanse nearly unimaginable

Ah flight!

The complectic drama of craft In space what complexity compressed to intelligent enclosure that follows by a trace expression through the ephemera in which is the grand harmony of the celestial spheres in motion Flight is traversal through time and space yet destination undetermined for so much of the plan that inheres unarticulated in our depths Why! To tell and smuggle the secret to the public eye and ear so lend the funds to which a proportion already allocated then distributed how but to focus on the centralizing endeavor of the human being in space

So call this here to the task of funding in the agency with the organizations the proportion rightly meant to set forth both body and mind out there The earliest hours' fruits of realizing the cornerstones to reaching the frame of the inhabitation by its crafts, logistics, and infrastructure

Oh the space age to begin ere a revolution!

Whether the Apollo and current Artemis endeavours would grow even to the scale of industry from a humble enterprise of endowment This future not taken for granted but earned with honesty and integrity deduction from the dream inheritance of the American People by their heritage of high voyages by high seas the discovery engendering and settling a new world now almost a figment of history These fathoming be recollected to drive to motivate the start to birth a new emergent the keeps to the cosmos at large the wide dimension of an infinite variety to arrive at our steps by destiny to manifest over long long future where a new cosmos or world be born

For the integrity of the agency cannot be doubted if all course is good and right the definite is that the budget well geared for not just the present but too the future yet So close examination of all points in time keep the budget right and good. That a Future glorious and continuing shall mean its full course into each phase for the tomorrow when a world is raised. The profit long last is Destiny's return that society should gaze up and know the world to come is humanity's own
So path to the stars is paved not with platinum but steadfast commitment a belief in a world to come

The human body has to go to space, and the mind too An Inquiry of cosmic relevance to lay open through disclosure what possible entirety the assertion of presence into the universe could lead to self knowledge by humanity of a kind that is epic in scale, of the endeavour

Of no matter seeming insignificance the size of our bodies but that virtual or real potential that understates the true meaning of being human a nobility indescribable the highest and the lows of the steady mind to raise itself above the mundane to what profundity our existence in proportion truly can rise up to, that heavenly sphere yet to vulgar knowledge spoken of, but even beyond this planet's energetic provision, the extensiveness of the cosmic fabric, to our reach?

The pleasantry of arising in wakefulness to the rise of Orion so fears subside in a seeming rain
This we must to our recall what dream scattered everywhere in fragments from our imagination does spell out the genetics given by our own American history Voyage unending, ceaseless, to continue into perpetuity for the longevity of our race to be.

Talk about infinitude but an inner peaceful eye outwards to a value incommensurable to representation Flight is high so something to be known but beyond our make is an impossibility bridged by instrument and dream. Recollection can find only what had been ours but if more had been known than memory can recall by infinitudes reflection of what lost suddenly becomes clear as crystal so even stars almost infinitely away becomes of sense

That the Plan in its dynamic structuring is not to detract on the goal but to focus on it The Plan in its exactitude is in dynamic execution the sums of each period's activity giving a status the snapshot of what could be commented by translation into representation, for internal acknowledgment for public awareness.

All the moments in their precise positions respectively could not be determined at once by a current snapshot but is included as comprehensible by any moment's understanding for the Understanding is stable, the same, across time, but yet articulated today is an opportunity to be seized as the day's work. Membership to the enterprise in general at the agency and beyond predicates on this understanding not to stay tacit and unspoken in the definite future but respectfully becomes overt on one or many dimensions of communication. This pertains to the Plan that is realized discretely to each phase as in correspondence and in accordance to the Schedule of the Budget. Projectively, the budget relies on a basic realism that funds are not unlimited but can be set to forecast that bases itself in the reality of the relativism of sums in context of spending in gross and proportionate amounts elsewhere.

For that such a schedule is viable, understanding must not merely be of goals and objectives, but consensus be reached on the realism of financing and allocation so that means in technology and logistics be achievable for any particular period.

The calculus then is of a balance, a fine balance certainly not precarious, where all courses are upon the same Dream, and petty distinctions and poor profit not to overwhelm the cohesion.

Comprehended by a grand dialectical gesture that appears to unsuspecting glance a flawless motion is to have the Plan in bloom so all including those who support may take delight in the grandeur of the manned missions space program Continuum be found in a cognized self awareness by the program of it as situated in the reality of economy, the agency must make itself aware by itself the real allocation to this great goal, here through its own means, thus of the annual or recurring budget of granted monies projectedly in the sum of

\$, the proportion be adjusted so input to the manned missions space program by the gravitas of the agency described in Transitionary Proportioning in the amount from \$ in year 20 , to increase to

\$ by year 20 .
